Day 18–19: IRT–BKT Integration (phần lý thuyết quan trọng nhất)

Như trong mô tả: **θ (IRT ability) và $P(L)$ (BKT mastery) là 2 dimension độc lập**. θ ảnh hưởng BKT theo 3 kênh:

def init_bkt_with_irt(kc_id: str, theta: float) -> BKTState:

"""

IRT theta điều chỉnh BKT params KHI KHỞI TẠO KC mới.

KÊNH 1: $\theta \rightarrow P(L0)$ cao hơn cho HS giỏi

"Dạy A, HS giỏi hiểu ngay A+1 $\rightarrow P(L0)$ của A+1 tự động cao"

sigmoid($\theta - 0.5$) scaled [0.05, 0.45]

KÊNH 2: $\theta \rightarrow P(S)$ thấp hơn (ít bất cẩn hơn)

HS giỏi ít mắc lỗi careless $\rightarrow P(S)$ giảm theo θ

KÊNH 3: $\theta \rightarrow P(T)$ cao hơn (học nhanh hơn)

HS giỏi absorb content nhanh hơn

KHÔNG thay đổi: $P(G)$ — xác suất đoán mò không phụ thuộc vào θ , mà phụ thuộc vào loại câu hỏi (MCQ 4 options $\rightarrow P(G)=0.25$ luôn).

IRT kiểm soát $P(G)$ bằng cách chọn câu KHÓ hơn cho HS giỏi (câu khó hơn $\rightarrow P(G)$ hiệu dụng thấp hơn, vì HS khó đoán đúng hơn).

"""

base = db.get_kc_params(kc_id) # default BKT params cho KC này

Kênh 1: $P(L0)$ tăng theo θ

```

p_know0 = 0.05 + 0.40 / (1 + np.exp(-(theta - 0.5)))

# Kênh 2: P(S) giảm theo  $\theta$  (bounded)
p_slip = max(0.04, base['p_slip'] - 0.015 * np.clip(theta, -2, 2))

# Kênh 3: P(T) tăng nhẹ theo  $\theta$ 
p_transit = min(0.85, base['p_transit'] + 0.04 * np.clip(theta, -2, 2))

    due = []
    for kc in mastered:
        days = (now() - kc['last_practiced']).days
        p_now = fc.p_at_time(kc['p_at_mastery'], days, kc['stability'])
        if p_now < fc.THRESHOLD:
            due.append({'kc': kc, 'p_now': round(p_now, 3)})
    return sorted(due, key=lambda x: x['p_now']) # urgency order

```

Day 25–27: React frontend (5 screens)

Screen	Key components
Assessment	Câu hỏi + θ estimate bar (hiển thị cho admin, ẩn với HS)
Learning	Video player + BKT progress arc (0→95%) + practice item
Mastery	Celebration + "ôn lại sau X ngày"
Dashboard	KST graph (react-force-graph) + review queue (due today/this week)
Review	Spaced repetition queue, sorted by urgency

Day 28–30: Calibration và params mặc định

IRT khi chưa có data (cold start):

Param	Default	Lý do
a	1.0	Discrimination trung bình
b	0.0	Medium difficulty ($\omega=0$)
c	0.25	MCQ 4 options: 1/4
θ_0	0.0	Ability trung bình

Sau khi có 50+ responses/item → refit a , b , c bằng MML-EM (`py-irt` library).

BKT khi chưa có data:

Param	Default	Adjust range
$P(L_0)$	0.10	0.05–0.40 theo KC và θ
$P(T)$	0.30	0.20–0.85 theo KC type + θ
$P(G)$	0.25	Fixed theo format câu hỏi
$P(S)$	0.10	0.04–0.15 theo θ

Sau khi có data → dùng EM để fit params per KC:

```
from scipy.optimize import minimize
```

```

def fit_bkt_params(responses: list) -> dict:
    """EM-style MLE để fit P(T), P(G), P(S) cho từng KC"""
    def neg_ll(params):
        p_l0, p_t, p_g, p_s = np.clip(params, 0.01, 0.99)
        ll = 0
        for student_responses in responses:
            p_l = p_l0
            for correct in student_responses:
                p_obs = p_l*(1-p_s) + (1-p_l)*p_g
                ll += np.log(p_obs if correct else 1-p_obs + 1e-9)
                p_post = p_l*(1-p_s)/p_obs if correct else p_l*p_s/(1-p_obs)
                p_l = p_post + (1-p_post)*p_t
            return -ll

    res = minimize(neg_ll, x0=[0.1, 0.3, 0.25, 0.1],
                   bounds=[(0.01,0.5),(0.01,0.99),(0.01,0.5),(0.01,0.3)])
    p_l0, p_t, p_g, p_s = res.x
    return {'p_know0': p_l0, 'p_transit': p_t, 'p_guess': p_g, 'p_slip': p_s}

```

Notes triển khai quan trọng

Tech stack tối giản cho 1 tháng: Python (FastAPI) + PostgreSQL + Redis (session cache) + React + NetworkX + NumPy/SciPy. Tránh over-engineer ở giai đoạn này.

Về KST graph: cần ít nhất 20–30 KCs cho 1 unit để hệ thống có đủ depth để traverse. Validate bằng `nx.is_directed_acyclic_graph(G)` — nếu có cycle thì KST navigation sẽ bị loop vô hạn.

Về IRT cold start: với item chưa calibrate, dùng default `a=1.0`, `b=0.0`, `c=0.25`. Kết quả ZPD sẽ không perfect nhưng đủ tốt để demo. Sau khi có data, chạy MML-EM batch calibration qua đêm.

Về BKT threshold (0.95): có thể lower xuống 0.90 cho giai đoạn đầu để học sinh cảm giác tiến bộ nhanh hơn. Tune theo domain và age group.
